ABSTRACT:

This invention is directed to the <u>crystal</u> structure of <u>Acyl Carrier Protein</u>

<u>Synthase (ACPS)</u> complexed with <u>Acyl Carrier Protein (ACP)</u>, the solution structure of B. subtilis <u>ACP</u>, and to the use of these structures in rational drug design methods to identify agents that may interact with active sites of <u>ACPS</u> and <u>ACP</u>, and to the testing of these agents to identify agents that may represent novel antibiotics.

ABSTRACT:

Disclosed is a methods for modifying the chain length and double bond positional specificities of a soluble plant fatty acid desaturase. More specifically, the method involves modifying amino acid contact residues in the substrate binding channel of the soluble fatty acid desaturase which contact the fatty acid. Specifically disclosed is the modification of an acyl-ACP desaturase. Amino acid contact residues which lie within the substrate binding channel are identified, and subsequently replaced with different residues to effect the modification of

activity.

INT-CL (IPC): C12 Q 1/48

ABSTRACTED-PUB-NO: US20040161813A

BASIC-ABSTRACT:

NOVELTY - A <u>crystal</u> (I) of a binding complex between beta -ketoacyl <u>acyl carrier protein (ACP)</u> synthase I (FabB) and thiolactomycin (TLM), or FabB and cerulenin, that effectively diffracts <u>X-rays</u> for the determination of the <u>atomic coordinates</u> to a resolution of better than 3.5 Angstrom , is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- (1) obtaining (M1) a crystal of an inhibitor-FabB complex, comprising growing a crystal of the inhibitor-FabB complex in a buffered solution containing 2.0 M ammonium sulfate, and 20% polyethylene glycol (PEG) 400;
- (2) a computer containing within its memory a representation of the FabB-cerulenin binding complex or its portion, or FabB-TLM binding complex or its portion, comprising a machine-readable data storage medium comprising data storage encoded with machine-readable data that contains atomic coordinates for the FabB-cerulenin complex or FabB-TLM complex, a working memory for storing instructions for processing the machine-readable data, a central processing unit coupled to the working memory and to the machine-readable data storage medium for processing the machine readable data into three-dimensional representation of the FabB-cerulenin binding complex or its portion, or FabB-TLM binding complex or its portion, and a display coupled to the central-processing unit for displaying the three-dimensional representation;
- (3) identifying (M2) an agent for use as an inhibitor of bacterial fatty acid synthesis using (I), involves (a) selecting a potential agent by performing rational drug design with the atomic coordinates determined from (I), or selecting a potential agent by performing rational drug design with the set of atomic coordinates of FabB-cerulenin binding complex and/or FabB-TLM binding complex, where the selecting is performed in conjunction with computer modeling, (b) contacting the potential agent with a beta -ketoacyl-ACP synthase, and (c) measuring the activity of the beta -ketoacyl-ACP synthase, where a potential agent is identified as an agent that inhibits bacterial fatty acid synthesis when there is a decrease in the activity of the beta -ketoacyl-ACP synthase, or when there is a decrease in the activity of the beta -ketoacyl-ACP synthase in the presence of the agent relative to in its absence;
- (4) identifying (M3) an agent that inhibits bacterial growth using the <u>atomic</u> <u>coordinates</u> obtained from (I), involves step (a) of (M2), contacting the potential agent with a bacterial culture, and measuring the growth of the bacterial culture, where a potential agent is identified as an agent that inhibits bacterial growth when there is a decrease in the growth of the bacterial culture; and
- (5) selecting (M4) a compound that potentially inhibits fatty acid synthesis, involves defining the structure of the FabB-inhibitor complex by the <u>atomic</u> coordinates of FabB-cerulenin binding complex and/or FabB-TLM binding complex, and selecting a compound which potentially inhibits fatty acid synthesis, where the selecting is performed with the aid of the structure defined in above step.

ACTIVITY - Antibacterial.

MECHANISM OF ACTION - Fatty acid synthesis inhibitor.

USE - (I) is useful for identifying an agent for use as an inhibitor of bacterial fatty acid synthesis, identifying an agent that inhibits bacterial growth, and for selecting a compound that potentially inhibits fatty acid synthesis (claimed). (I)
